APPLICATION OF ADOMIAN DECOMPOSITION METHOD, TAYLOR SERIES METHOD AND A VARIATIONAL ITERATIONS METHOD TO SOLVING A SECOND ORDER ORDINARY DIFFERENTIAL EQUATIONS

#### Abstract

In this paper, the Cauchy problem with the second order ordinary differential equations is solved analytically using the Adomian decomposition method, Taylor series method and the variational iteration method. It is shown that these methods are the most effective and convenient for solving some evolution equations. The obtained approximate solutions were compared, the results of these methods are the same; while the method of decomposition of Adomian can be much simpler, more convenient and more efficient to approach such problems as compared to the method of variational iteration and other traditional methods.

Key words: second order ordinary differential equations, Cauchy problem, variational iteration method, Adomian decomposition method, Taylor series method, exact solutions.

## I. Introduction.

Nonlinear phenomena are of fundamental importance in various fields of science and technology. Nonlinear models of real-world problems are still difficult to solve either numerically or theoretically. Recently, much attention has been paid
to the search for better and more efficient approximate or exact, analytical or numerical methods for solving for nonlinear models [ $6,7,10,11]$. There are many standard semi-analytical methods for solving linear and nonlinear partial or ordinary differential equations, for example, the Adomian decomposition

method, Taylor series method and the variational iterations method [6-12].

The Adomian decomposition method and the variational iterations method is one of the wellknown methods for solving various linear and nonlinear evolution equations. Many studies have proven that these methods are reliable and effective for a wide range of scientific applications, linear and nonlinear equations with bounded and unbounded domains [17]. These methods have no special requirements, such as linearization, small parameters, and so on for nonlinear operators. Below, the Cauchy problem with the second order ordinary differential equations are solved analytically using the Adomian decomposition method, Taylor series method and variational iterations method.

## II. Analysis of the methods.

1) Adomian decomposition method.

Considering the differential equation below in an operator form as

$$
\begin{equation*}
L u+R u=f \tag{1}
\end{equation*}
$$

In this case $L$ is mostly the lower order derivative assumed to be invertible, $R$ is other differential operator while $f$ is the source term. Applying $L^{-1}$ to both sides of equation (1) and imposing the given conditions, we have

$$
\begin{equation*}
u=h-L^{-1}(R u) \tag{2}
\end{equation*}
$$

where the function $h$ represents given conditions and the source term. The standart Adomian decomposition method gives the solution of $u$ by and infinite series of components written as

$$
\begin{equation*}
u=\sum_{n=0}^{\infty} u_{n} \tag{3}
\end{equation*}
$$

where the components $u_{0}, u_{1}, u_{2}, \ldots$ are determined recursively. Substituting (3) into (2) yields

$$
\begin{equation*}
\sum_{n=0}^{\infty} u_{n}=h-L^{-1}\left[R\left(\sum_{n=0}^{\infty} u_{n}\right)\right] \tag{4}
\end{equation*}
$$

We then determine the solution by identifying the zeroth components as

$$
\begin{equation*}
u_{0}=h \tag{5}
\end{equation*}
$$

and the remaining components are written as the recursive relation

$$
\begin{equation*}
u_{n+1}=-L^{-1}\left[R\left(u_{n}\right)\right], \quad n \geq 0 \tag{6}
\end{equation*}
$$

2) Variational iterations method.

Considering the differential equation below in an operator form as

$$
\begin{equation*}
L u+N u=f(t) \tag{7}
\end{equation*}
$$

where $L$ is linear operator, $N$ is a nonlinear operator and $f(t)$ is known analytical function.

According to the variational iterations method, we can construct a correction functional as follows:

$$
\begin{equation*}
u_{n+1}(t)=u_{n}(t)+\int_{0}^{t} \lambda(\xi)\left[L u_{n}(\xi)+N \tilde{u}_{n}(\xi)-f(\xi)\right] d \xi \tag{8}
\end{equation*}
$$

where $\lambda$ is a general Lagrange multiplier, which can be identified optimally via the variational theory (He, 2007), the subscript $n$ denotes the $n$th approximation and $\tilde{u}_{n}$ is considered as a restricted variation, i.e., $\delta \widetilde{u}_{n}=0$

It is obvious now that the main steps of the variational iterations method require first the determination of the Lagrangian multiplier $\lambda$ that will be identified optimally. Having determined the Lagrangian multiplier, the successive approximations $u_{n+1}, n \geq 0$, of the solution $u$ will be readily obtained upon using any selective function ${ }^{u_{0}}$. Consequently, the solution

$$
\begin{equation*}
u=\lim _{n \rightarrow \infty} u_{n} \tag{9}
\end{equation*}
$$

Lagrange multiplier can be easily identified as:

$$
\begin{equation*}
\lambda(\xi)=(-1)^{m} \frac{1}{(m-1)!}(\xi-t)^{m-1} \tag{10}
\end{equation*}
$$

## III. Application methods and results.

Example. Consider the second order ordinary differential equations

$$
y^{\prime \prime}-5 y^{\prime}=5, \quad y(0)=1, \quad y^{\prime}(0)=1, \quad 0<x<3
$$

We find the exact solution to the problem

$$
y(x)=0,4 e^{5 x}+0,6-x
$$

1) Adomian decomposition method.

$$
y^{\prime \prime}=5+5 y^{\prime} \Rightarrow L^{-1} y^{\prime \prime}=L^{-1}\left(5+5 y^{\prime}\right)
$$

where $L(\cdot)=\frac{d^{2}(\cdot)}{d x^{2}}$ and $L^{-1}(\cdot)=\int_{0}^{x} \int_{0}^{x}(\cdot) d \xi$, then

$$
y(x)=1+x+\frac{5 x^{2}}{2}+5 \int_{0}^{x} \int_{0}^{x} y^{\prime}(\xi) d \xi
$$

According to ADM we search for the solution as
follows: $y(x)=\sum_{k=0}^{\infty} y_{k}(x)$.
This,

$$
\begin{aligned}
& y_{0}+y_{1}+y_{2}+\ldots=1+x+\frac{5 x^{2}}{2}+ \\
& +5 \int_{0}^{x} \int_{0}^{x}\left[y_{0}^{\prime}+y_{1}^{\prime}+y_{2}^{\prime}+\ldots\right] d \xi
\end{aligned}
$$

now

$$
y_{0}=1+x+\frac{5 x^{2}}{2}
$$

| ISRA (India) | $=3.117$ |
| :--- | :--- |
| ISI (Dubai, UAE) | $=0.829$ |
| GIIF (Australia) | $=0.564$ |
| JIIF | $=\mathbf{1 . 5 0 0}$ |

$$
y_{1}=5 \int_{0}^{x} \int_{0}^{x} y_{0}^{\prime} d \xi=\frac{5 x^{2}}{2}+\frac{25 x^{3}}{3!}
$$

$$
y_{2}=5 \int_{0}^{x} \int_{0}^{x} y_{1}^{\prime} d \xi=\frac{25 x^{3}}{3!}+\frac{125 x^{4}}{4!}
$$

$$
y_{n}=5 \int_{0}^{x} \int_{0}^{x} y_{n-1}^{\prime} d \xi=\frac{5^{n} x^{n+1}}{(n+1)!}+\frac{5^{n+1} x^{n+2}}{(n+2)!}
$$

$$
y(x)=\sum_{k=0}^{\infty} y_{k}(x)=1+x+\sum_{n=1}^{\infty} \frac{2 \cdot 5^{n} x^{n+1}}{(n+1)!}=
$$

$$
=1-x+\sum_{n=0}^{\infty} \frac{2 \cdot 5^{n} x^{n+1}}{(n+1)!}=1-x++0,4 \cdot \sum_{n=0}^{\infty} \frac{(5 x)^{n+1}}{(n+1)!}
$$

$$
=0,6-x+0,4 \cdot \sum_{n=0}^{\infty} \frac{(5 x)^{n}}{n!}=0,6-x+0,4 \cdot e^{5 x}
$$

The found solution to be compatible with the exact solution.
2) Variational iterations method. To solve the VIM problem, we first use the replacement

$$
y(x)=1+\int_{0}^{x} z(\xi) d \xi \quad z(0)=1
$$

The formula of VIM is

$$
z_{k+1}(x)=z_{k}(x)+\int_{0}^{x} \lambda(\xi)\left(z_{k}^{\prime}-5 z_{k}-5\right) d \xi
$$

Where $\lambda(\xi)$ - Lagrange multiplier, and for the stationary case $\left.\lambda^{\prime}(\xi)\right|_{\xi=x}=0 ; \quad 1+\left.\lambda(\xi)\right|_{\xi=x}=0$ and from here we have $\lambda(\xi)=-1$. Then we have

$$
z_{k+1}(x)=z_{k}(x)-\int_{0}^{x}\left(z_{k}^{\prime}-5 z_{k}-5\right) d \xi
$$

Now applying VIM, we get the following results:
$z_{0}=1 ; \quad z_{1}=1+10 x ; \quad z_{2}=1+10 x+25 x^{2} ;$ $z_{3}=1+10 x+25 x^{2}+\frac{125 x^{3}}{3}$;

| SIS (USA) | $=\mathbf{0 . 9 1 2}$ | ICV (Poland) | $=\mathbf{6 . 6 3 0}$ |
| :--- | :--- | :--- | :--- |
| PИHL (Russia) | $=\mathbf{0 . 1 5 6}$ | PIF (India) | $=\mathbf{1 . 9 4 0}$ |
| ESJI (KZ) | $=\mathbf{8 . 7 1 6}$ | IBI (India) | $=\mathbf{4 . 2 6 0}$ |
| SJIF (Morocco) | $=\mathbf{5 . 6 6 7}$ | OAJI (USA) | $\mathbf{0 . 3 5 0}$ |

$$
\begin{aligned}
& z_{4}=1+10 x+25 x^{2}+\frac{125 x^{3}}{3}+\frac{625 x^{4}}{12} ; \ldots ; \\
& z_{n}=2 \cdot \sum_{k=0}^{n} \frac{(5 x)^{n}}{n!}-1 \quad \text { and so on. }
\end{aligned}
$$

According to them
$y_{0}=1+x$;
$y_{1}=x+5 x^{2} ;$
$y_{2}=x+5 x^{2}+\frac{25 x^{3}}{3}$;
$y_{3}=x+5 x^{2}+\frac{25 x^{2}}{3}+\frac{125 x^{4}}{12}$;
$y_{4}=x+5 x^{2}+\frac{25 x^{2}}{3}+\frac{125 x^{4}}{12}+\frac{625 x^{5}}{120} ; \ldots$
$y_{n}=1-x+0,4 \cdot \sum_{k=0}^{n} \frac{(5 x)^{n+1}}{(n+1)!}$
and so on.
3) Taylor series method.

$$
y^{\prime \prime}=5+5 y^{\prime}, \quad y(0)=1, \quad y^{\prime}(0)=1
$$

$$
y^{(n)}=\left.5 y^{(n-1)} \Rightarrow y^{(n)}\right|_{x=0}=\left.5 y^{(n-1)}\right|_{x=0}, \quad n>2
$$

$y^{\prime \prime}(0)=10 ; \quad y^{\prime \prime \prime}(0)=50 ; \quad y^{I V}(0)=250 ;$ $y^{V}(0)=1250 ; \ldots ; y^{(n)}(0)=2 \cdot 5^{n-1}$ and so on.

Recall that the Taylor expansion of $y(x)$ is given by

$$
\begin{aligned}
& y(x)=y(0)+\frac{y^{\prime}(0)}{1!} x+\frac{y^{\prime \prime}(0)}{2!} x^{2}+ \\
& +\frac{y^{\prime \prime \prime}(0)}{3!} x^{3}+\ldots+\frac{y^{(n)}(0)}{n!} x^{n}+\ldots
\end{aligned}
$$

then

$$
\begin{aligned}
& y(x)=1+x+5 x^{2}+\frac{50}{3!} x^{3}+\ldots+\frac{2 \cdot 5^{n-1}}{n!} x^{n}+\ldots= \\
& =0,6-x+0,4 e^{5 x}
\end{aligned}
$$

The result of the difference between the exact and approximate solution alongside the Absolute error $E_{A}$, shown in the Table I below:

## IV. Conclusions.

In this work, ADM, TSM and VIM were successfully applied to solve the Cauchy problem with the second order ordinary differential equations. It is obvious that VIM an ADM are very powerful and
effective methods for finding analytical solutions for wide classes of problems. It is worth noting that these two methods are a quick convergence of solutions. Application of ADM to the problems discussed has more advantages than VIM and most other methods; it overcomes the difficulties in calculating other
